

Practice Project: Build a Multi-Page Website Using HTML & CSS

Project Overview

In this practice project, you will design and build a **responsive multi-page website** using only **HTML and CSS**. The goal is to demonstrate your ability to create a complete website with multiple connected pages, structured content, visual styling, and clean organization.

Your website must include several types of content and components, including:

- multiple linked pages
- images
- multimedia
- table
- list
- form
- external CSS styling
- responsive layout

This project should reflect the skills learned in the course and should be built in a clean, professional, and well-organized way.

Project Theme

You may choose **any suitable website theme**, such as:

- Travel Guide Website
- Small Business Website
- Restaurant Website
- Fitness / Gym Website
- Pet Care Website
- Event / Conference Website
- Learning / Tutorial Website
- Photography / Portfolio Website

You may also propose your own theme if it is appropriate and approved by the instructor.

Project Goal

Your goal is to create a website that looks and behaves like a small real-world website for a real client or audience.

The website must be:

- structured properly using HTML
- styled consistently using CSS
- responsive across different screen sizes
- connected through working navigation links
- uploaded to GitHub with multiple commits

Technical Requirements

1. HTML and CSS Only

You must use only:

- **HTML**
- **CSS**

Not allowed:

- JavaScript
- Bootstrap
- Tailwind
- React
- Any CSS or JS frameworks
- Website builders or ready-made templates

Unless your instructor explicitly approves otherwise.

2. External CSS File

You must use **at least one external CSS file**.

Your styling must **not** be written mainly as inline CSS.

3. Multi-Page Website

You must create **at least 4 pages**.

All pages must be connected using **working navigation links**.

4. Responsive Design

The website **must be responsive**.

This means the layout and content should remain usable and visually organized on different screen sizes, especially:

- desktop
- tablet
- mobile

You are expected to apply the CSS concepts learned in class to make the layout adapt as reasonably as possible.

Examples of responsive-friendly design include:

- flexible widths
- proper spacing
- readable text sizes
- responsive images
- layout adjustments for smaller screens

The site does not need to be perfect on every device, but it should clearly show effort toward responsive design.

5. GitHub Repository

You are encouraged to upload your project to a GitHub repository.

Requirements:

- all project files must be uploaded
- folder structure must be clean and organized
- you must make **multiple commits**

- minimum recommended: **6 meaningful commits**

Examples of good commit messages:

- Create project structure
- Add home page content
- Add gallery page and images
- Build contact form
- Style navigation and footer
- Improve responsive layout
- Final fixes and cleanup

Uploading everything in a single commit is not recommended.

6. AI Usage

You are **free to use AI tools** to help you complete this project.

AI may be used for:

- brainstorming the website idea
- planning page structure
- generating HTML/CSS examples
- improving page layout
- debugging HTML/CSS issues
- suggesting styling improvements
- organizing the folder structure
- writing draft text content
- explaining concepts and errors

However:

You are still responsible for:

- understanding the code you use
- checking that all pages work correctly
- validating all AI-generated output
- making sure your final project meets the requirements

AI should be used as a **helper and learning assistant**, not as a replacement for your own understanding.

Required Pages

You must create **at least 4 pages**.

You may add more pages if you want.

Page 1: Home Page

The Home page should introduce the website and welcome the user.

Must include:

- website title or logo area
- navigation menu linking to all pages
- hero section or welcome section
- introductory paragraph(s)
- at least **one image**
- at least **one list**
- footer

Purpose:

This page should clearly introduce the website topic and guide users to the other pages.

Page 2: About / Services / Information Page

This page should provide detailed structured information related to the website theme.

Must include:

- heading and subheadings
- paragraphs
- at least **one table**
- at least **one image**
- at least **one list**
- navigation menu
- footer

Examples:

- business website → services and pricing
- travel website → destinations and travel packages
- restaurant website → menu and opening hours
- event website → schedule and sessions

Purpose:

This page should demonstrate your ability to organize and present content clearly using headings, tables, and lists.

Page 3: Gallery / Media Page

This page should focus on visual or multimedia content.

Must include:

- at least **3 images**
- at least **one multimedia element**
 - either **audio**
 - or **video**
- short captions or descriptions
- navigation menu
- footer

Purpose:

This page should demonstrate your ability to embed and present multimedia content in a clean and organized layout.

Page 4: Contact / Registration Page

This page should include a form.

Must include:

- a form using HTML
- labels for all fields
- at least:

- text input
 - email input
 - textarea
 - select/dropdown
 - radio buttons or checkboxes
 - submit button
- navigation menu
- footer

Purpose:

This page should demonstrate your ability to build and style a complete form interface.

HTML Requirements

Your project must demonstrate correct use of:

- headings
- paragraphs
- links
- images
- lists
- tables
- forms
- semantic HTML elements such as:
 - header
 - nav
 - main
 - section
 - article
 - footer

You should use semantic elements where appropriate instead of relying only on generic containers.

CSS Requirements

Your project must demonstrate styling such as:

- typography

- colors
- spacing
- margins and padding
- borders
- backgrounds
- list styling
- table styling
- form styling
- navigation styling
- layout styling
- responsive layout adjustments

The website should have a **consistent visual style** across all pages.

Navigation Requirements

- all pages must include a navigation menu
 - all links must work correctly
 - users should be able to move easily between pages
 - the navigation should be styled consistently
-

File Structure Requirements

Your project files should be organized in a clean way.

Example structure:

```
project-folder/  
|  
├── index.html  
├── about.html  
├── gallery.html  
├── contact.html  
├── css/  
|   └── styles.css  
└── images/  
    └── ...
```

You may organize it slightly differently, but it must be logical and neat.

Project Output

You are encouraged to complete the following:

- Create a GitHub repository for your project
- Upload all project files with a clean folder structure
- Make multiple commits to track your progress
- Ensure your final website is complete and working

(Optional)

- Export your project as a ZIP file for backup
- Take screenshots of your final website

These steps will help you **build good development habits** and create a **portfolio-ready project**.

Practice Guidelines

While working on this project:

- Focus on using HTML and CSS only
- Avoid using frameworks unless you are experimenting beyond the core requirements
- Do not rely on fully pre-built templates
- Make sure your pages are complete and connected
- Aim to make your website reasonably responsive

The goal is **learning and practice**, not perfection.

Best Practices to Follow

Treat this project as if you are building a website for a real client.

Focus on:

- clean structure
- visual consistency
- usability
- readability
- responsiveness

- professionalism

Self-Checklist

Before wrapping up your project, try to ensure you have:

- at least 4 pages
- working navigation links
- one external CSS file
- at least one image on the site
- at least one multimedia element
- at least one table
- at least one list
- at least one form
- responsive layout
- clean folder structure
- GitHub repository with multiple commits

How to Evaluate Your Work

Since this is a practice project, use the following to evaluate yourself:

- Is your website structured correctly?
- Are all required elements included?
- Is the design consistent across pages?
- Does the site work on different screen sizes?
- Do you understand the code you've written?

The focus is on **learning, clarity, and improvement.**
