

Exercise: Dynamic Hello World with React

Objective

In this exercise, you will create a simple React component that displays a “Hello, world!” message and dynamically renders your name. This assignment reinforces the basics of React components, JSX, and dynamic data rendering.

Description

You will build a React application that renders a greeting message on the screen. The message should include your name, rendered dynamically using JavaScript inside JSX. The app should update automatically when the component is rendered, without reloading the page.

Concepts Covered

- Creating a React functional component
- Using JSX syntax
- Embedding JavaScript expressions in JSX
- Rendering components to the DOM
- Understanding dynamic content in React

Requirements

- Create a React component called HelloWorld (or similar)
- Display the text “Hello, world!” on the screen
- Dynamically display your name using a JavaScript variable
- Use JSX to render the message
- Render the component inside App.jsx

Suggested File

- App.jsx or HelloWorld.jsx

Example User Interaction

1. The app loads and displays “Hello, world!”
2. Your name appears dynamically in the message
3. Refreshing the page keeps the same greeting
4. Changing the name variable updates the displayed output

Running the Exercise

You can run this exercise locally to see it in action. Use the following command to start the app:

```
npm run dev
```

No file submission is required. This exercise is for practice only, allowing you to experiment, test your code, and explore React concepts.

Guidance and Self-Evaluation

Use the success criteria below to self-evaluate your work. You are encouraged to discuss this exercise, ask questions, and seek guidance during your weekly live sessions with your instructor.

Success Criteria

- The greeting message renders correctly
- Your name is displayed dynamically
- JSX syntax is used properly
- The app runs without errors
